A NON-HAUSDORFF TOPOLOGICAL SPACE IN WHICH  
EVERY CONVERGENT SEQUENCE CONVERGES TO A  
UNIQUE LIMIT

**Abstract: Does there exist a non Hausdorff topological space, such that every convergent sequence in it converges to a unique limit? Considering the obvious scarcity of such spaces we were compelled to construct one by ourselves.**

1. Let  $(X, T)$  be a topological space with  $X$  the underlying set on which the topology  $T$  is defined. Let  $\emptyset$  denote the empty set. Given  $x$  in  $X$ , let  $\wp(x) = \{U \in T: x \in U\}$ .  $(X, T)$  is said to be Hausdorff, if given  $x, y \in X$ , with  $x \neq y$ , [there exists  $U \in \wp(x), V \in \wp(y)$  such that  $U \cap V = \emptyset$ ]. Otherwise it is said to be non-Hausdorff.

A sequence in  $X$  is a function  $S: N \rightarrow X$  where  $N$  denotes the set of natural numbers. Let  $\mathcal{R}$  denote the set of real numbers and  $Q$  the set of rational numbers. Thus  $\mathcal{R} \setminus Q$  denotes the set of irrational numbers. Given  $a, b$  in  $\mathcal{R}$  with  $a < b$ , let  $(a, b) = \{x \in \mathcal{R}: a < x < b\}$ . A sequence  $S$  is said to converge to  $x$  in  $X$  if for every  $U$  in  $\wp(x)$  there exists  $M$  in  $N$  (possibly depending on  $U$  and  $x$ ) such that  $[n \in N, n \geq M$  implies  $S(n) \in U]$ . Let  $L(S) = \{x \in X: S \text{ converges to } x\}$ . An element of  $L(S)$  is called a limit of  $S$ . A sequence  $S$  is said to be convergent if  $L(S) \neq \emptyset$ .

Example 1: Let  $X = \{1, 2\}$  and  $T = \{\{1\}, \{2\}, \{1, 2\}, \emptyset\}$ . Let  $S: N \rightarrow X$  be defined as:  $S(n) = 1$  if  $n$  is odd;  $S(n) = 2$  if  $n$  is even. Then  $L(S) = \emptyset$ .

Example 2: Let  $X = \{1, 2\}$  and  $T = \{\{1, 2\}, \emptyset\}$ . Let  $S: N \rightarrow X$  be any sequence. Then,  $L(S) = X$ .

The following result is well known:

**Theorem 1:** If  $(X, T)$  is a Hausdorff topological space, then given any sequence  $S$ , either  $L(S) = \emptyset$  or  $L(S)$  is a singleton.

The result is by now very standard and a proof can be found in Lipschutz (1965) or Munkres (1975).

Let  $(X, T)$  be a topological space and let  $x \in X$ . It is said to be first countable at  $x$ , if there exists a countable subset  $\Omega(x)$  of  $\wp(x)$  such that for every  $U \in \wp(x)$  there exists  $V \in \Omega(x)$  with  $V \subset U$ . The topological space  $(X, T)$  is said to be first countable if it is first countable at every point in  $X$ .

The following result is well known and a proof can be found in Lipschutz (1965).

**Theorem 2:** Let  $(X, T)$  be a first countable topological space. If for every sequence  $S$ , either  $L(S) = \emptyset$  or  $L(S)$  is a singleton then  $(X, T)$  is Hausdorff.

The question that follows is: Does there exist a non-Hausdorff topological space, such that every convergent sequence in it converges to a unique limit? Clearly, in view of Theorem 2, such a space cannot be first countable. Considering the obvious scarcity of such spaces we were compelled to construct one by ourselves.

2. Let  $X = \mathbb{R} \cup \{*\}$ . For  $x$  in  $\mathbb{R}$  and  $\delta > 0$ , let  $I(x, \delta) = (x - \delta, x + \delta)$  and let  $I^0(x, \delta) = (x - \delta, x + \delta) \setminus \{x\}$ . Let  $A = \{1/n : n \in \mathbb{N}\}$ . Let  $B(0, \delta) = I(0, \delta) \setminus A$ , for all  $\delta > 0$ ;  $M(*, \delta) = (I^0(0, \delta) \cup \{*\}) \cap \mathbb{Q}$ , if  $\delta > 0$  and  $\delta$  is irrational;  $B(*, \delta) = [(I^0(0, \delta) \cup \{*\}) \cap (\mathbb{R} \setminus \mathbb{Q})] \cup (A \cap I^0(0, \delta))$ , if  $\delta > 0$  and  $\delta$  is rational;  $B(x, \delta) = I(x, \delta)$ , for all  $\delta > 0$ , whenever  $x$  belongs to  $\mathbb{R} \setminus \{0\}$ . Let  $T$  be the smallest topology containing  $\{B(x, \delta) : x \in X \text{ and } \delta > 0\}$ . Clearly,  $T$  is non-Hausdorff, since given any  $U$  in  $\wp(0)$  and  $V$  in  $\wp(*)$ ,  $U \cap V \neq \emptyset$ . Further, every convergent sequence in  $X$  converges to a unique limit. Indeed, if  $S$  is a convergent sequence in  $X$ , and belongs to  $X \setminus A$  infinitely often, then  $S$  converges to a unique real number. If  $S$  is eventually constant, then it converges to the unique element which occurs after a finite number of terms. If

**S is not eventually constant, but remains in A after a finite number of terms , then it converges to \*, and to no other element of  $X_n$ .**

**Acknowledgement** : I would like to put on record my very deep appreciation and thanks to Jayant Varma for having motivated me to the main result. I would also like to thank Mamoru Kaneko for pointing out an obvious error in the definition of a Hausdorff space. However, the sole responsibility for whatever errors that might remain rests with the author.
